

BugLens

AI RUNTIME DEBUGGING PLATFORM

See bugs before your users do.

Autonomously drives your app in a real browser, catches runtime failures,
and delivers plain-English bug reports — before a single user is affected.

RUNTIME-FIRST · BROWSER-NATIVE · AI-EXPLAINED

"Code works" ≠ "App works."

AI lets developers ship faster than ever. But testing hasn't caught up.

Static analysis, lints, and post-deploy monitoring all miss what actually breaks: the live app.

THE GAP

Code compiles. Tests pass. Lints clean.

Login button 500s. Form eats input. Page hydrates blank.

68%

of web app bugs are runtime issues
never caught in development

UNDETECTED AT RUNTIME:

Broken Buttons

Failed API Calls

Crashed Routes

Infinite Loaders

Form Submit Bugs

Nav Breaks

Hydration Errors

Render Glitches

The gap between shipping and working is where users find bugs first.

Everyone's Using the Wrong Tools

Cursor / Copilot

AI Code Helpers

✗ Read code. Can't see a broken button.

ESLint / TypeScript

Static Analysis

✗ Flag syntax. Blind to runtime failures.

Sentry / Datadog

Error Monitoring

✗ Alerts after users hit the bug. Too late.

Manual QA

Human Testing

✗ Slow, expensive, and misses edge cases.

The Real Gap Nobody's Closing

None of these tools open a browser and click around like a real user. That's where bugs live — until your users find them.

An AI Agent That Uses Your App

So you don't ship the bugs. BugLens autonomously tests your frontend so you never have to.

01

Drives the App

A Playwright agent navigates routes, clicks buttons, fills forms, and reloads pages — exactly like a real user, but tireless and methodical.

02

Watches Everything

Captures JS errors, failed requests, console warnings, hydration failures, dead UI, and infinite loaders the moment they happen.

03

Explains the Bug

An LLM correlates error traces with your source code to write plain-English reports: what broke, where it lives, and how to fix it.

From Upload to Report in One Autonomous Run

Developer clicks one button. The agent handles discovery, interaction, monitoring, mapping, and explanation — autonomously.

Four Layers, One Autonomous Run

What the Agent Does — and What It Catches

ACTIONS — The Agent Uses Your App

- Discovers and walks every route
- Clicks buttons and interactive elements
- Fills and submits forms with edge cases
- Validates inputs with unexpected data
- Reloads pages to test hydration stability
- Follows navigation flows end-to-end
- Tests responsive interactions

SIGNALS — Real-Time Error Detection

- JS Console Errors
- Failed API Requests (4xx / 5xx)
- 404 Pages & Missing Routes
- Hydration Errors
- Infinite Loading States
- Dead / Unresponsive Buttons
- Missing Assets & Render Glitches

Evidence Collection + Intelligent Reporting

SAMPLE BUG REPORT

● CRITICAL — Disaster Score: 8.5 / 10

Problem: Login button triggers 500 API error on submit.

File: components/LoginForm.jsx

Cause: Form sends undefined email — state not initialized.

Fix: Initialize email state: `const [email, setEmail] = useState("")`.

Route: /auth/login · Reproduced 3/3 attempts

Severity Scale:

8.5

No One Is Doing What BugLens Does

Capability	BugLens	Sentry/Datadog	ESLint/TS	Manual QA
Real browser interaction	✓	✗	✗	⚠️ Slow
Catches runtime crashes	✓	⚠️ After users	✗	⚠️ Slow
Zero config required	✓	✗	✗	✓
AI plain-English reports	✓	✗	✗	✗
Source file mapping	✓	⚠️ Partial	✓	✗
Severity scoring	✓	⚠️ Manual	✗	⚠️ Manual
Pre-deploy coverage	✓	✗	✓ (code only)	⚠️ Slow
Automated & scalable	✓	✓	✓	✗

Stop letting your users be your QA team.

Know What to Fix Before Your Users Do

0–2

LOW

Minor UI glitches
No user impact

3–5

MEDIUM

Broken flows
Some users affected

6–8

HIGH

Critical features down
Majority affected

9–10

CRITICAL

App unusable
Fix before deploy

REAL EXAMPLES FROM A DEBUG RUN:

Login form sends undefined email

Score: 8.5

Missing auth token on API calls

Score: 9.2

Dashboard chart renders blank

Score: 5.1

404 on /profile/settings route

Score: 6.8

This Is Just the Beginning.

BugLens is already powerful — but the surface area for what it can do is enormous. Every direction we look, there's more to build.

1

Where We Are

Core Engine — Live

- React / Next.js / Vite support
- Docker sandbox isolation
- Playwright browser agent
- AI bug reports + Disaster Score

2

Massive Headroom

Next Unlocks

- Auth flows & protected routes
- One-click auto-fix suggestions
- Accessibility + SEO deep audits
- Multi-framework expansion

3

The Ceiling Is High

Full Platform Vision

- Visual regression at scale
- AI-written test suites, zero effort
- Plug into any CI/CD pipeline
- SaaS — debug any app, anywhere

BugLens

AI Runtime Debugging Platform

Your users shouldn't be your QA team.

68%
